

Appendix C: IEEE 830 Template

Software Requirements Specification

For:

«Campus Focus Room (Study Booth) Booking System»

Version «1.0.4»

Prepared by «Norbert Fila»

«LODZ UNIVERSITY OF TECHNOLOGY - IFE»

«03.05.2026»

Revision History

Name	Date	Reason for Changes	Version
«Norbert Fila»	«10.3.2026»	«Initial Version»	«1.0.0»
Norbert Fila	17.03.2026	Added Use Case UML Diagram [Sec 3.0], Hardware Interfaces [Sec 4.2] and Administrator user class [Sec 2.3]	1.0.1
Norbert Fila	24.03.2026	Added UML Class Diagram [Sec 4.3]	1.0.2
Norbert Fila	14.04.2026	Added Sequence [Sec 4.3], State [Sec 5.1], and Activity [Sec 5.2] diagrams with PIN/QR access logic.	1.0.3
Norbert Fila	03.05.2026	Reduce technical details, clarified hardware integration (sensors/displays)	1.0.4

1. Introduction

1.1. Purpose

«The purpose of this document is to specify the software requirements for the Focus Room Booking System, Version 1.0.4. This Software Requirements Specification provides a comprehensive description of the system's core capabilities. It covers the entire scope of the initial product, which includes user authentication, real-time room availability tracking, booking limit enforcement, and authentication.»

1.2. Document Conventions

«This document adheres to the IEEE Std 830 guidelines for Software Requirements Specifications. . Every functional and non-functional requirement is assigned a unique identifier (e.g., REQ-1.1, NF-1.1) to ensure full traceability. It is assumed that every requirement statement possesses its own priority and operates as an independent, testable unit.»

1.3. Intended Audience and Reading Suggestions

«This document is intended for a diverse audience involved in the lifecycle of the Focus Room Booking System. The primary readers and suggested reading sequences are as follows:

Project Managers and Stakeholders: Should review Section 1 (Introduction) and Section 2 (Overall Description) to gain a comprehensive understanding of the product scope, business objectives, and system context.

Software Developers and Architects: Should focus heavily on Section 4 (External Interface Requirements), Section 5 (System Features/Modules), and Section 6 (Nonfunctional Requirements) for detailed technical specifications required for system implementation.

Quality Assurance (QA) and Testing Teams: Should utilize Section 5 and Section 6 as the definitive source for developing test plans, test cases, and validation procedures based on the specified functional and non-functional criteria.»

1.4. Product Scope

«The Campus Pod Booking System is a centralized web application designed to manage the reservation of soundproof study booths across the university. Currently, the lack of a structured reservation process for these individual units is causing significant frustration among students.

The primary objective of this system is to optimize resource utilization by providing a transparent, automated booking workflow. Key benefits include real-time availability tracking of individual pods, prevention of double-booking, and automated reservation release based on physical booth occupancy sensor data.

By ensuring equitable access to quiet study environments and eliminating scheduling conflicts, the software directly aligns with the university's goal of providing a highly efficient and supportive academic infrastructure.»

2. Overall Description

2.1. Product Perspective

«The Campus Pod Booking System is a new, self-contained software solution designed to manage a distributed network of acoustic study booths located throughout the university campus.

Unlike traditional room-booking tools, this system focuses on high-density, autonomous pods that provide soundproof environments for individual work. Currently, students and staff struggle to locate these units or verify their occupancy in real-time, often finding them occupied without a formal schedule.

The proposed system provides a centralized platform allowing users to pinpoint available pods via a mobile-friendly interface and reserve them for specific time slots. The system operates as a web-based application, optimized for mobile browsers to support "on-the-go" reservations. It manages unit availability, synchronization with on-site sensors, and administrative control over the entire booth fleet.

The system is intended to maximize the utilization of these specialized campus resources and provide a structured, friction-less method for accessing private study modules.

»

2.2. Product Features

- Viewing available focus rooms on campus
- Displaying the availability schedule for each room
- Reserving a focus room for a selected time slot
- Viewing and managing user reservations
- Canceling existing reservations

2.3. User Classes and Characteristics

«Students represent the primary user group of the system.

They will use the system to find available focus rooms and make reservations for studying or individual work.

Characteristics:

- basic technical knowledge
- frequent system usage during the academic semester
- access through mobile devices or laptops

Administrators represent the secondary user group of the system. They will use the system to manage the study booth catalog, monitor user reservations, and oversee daily operations.

Characteristics:

- periodic system usage during administrative working hours
- system usage focused on daily management during regular office hours

»

2.4. Operating Environment

The system shall operate in the following environment:

- web application accessible through all modern browsers, working well on mobile and desktop.
- The system will be hosted on a university server or cloud infrastructure.

2.5. Design and Implementation Constraints

The development of the system may be limited by the following constraints:

- access to the system requires valid university authentication credentials
- the system must support multiple concurrent users during peak academic hours
- the system must follow university data privacy and security policies

2.6. User Documentation

The following documentation will be provided to support system users:

- a user guide explaining how to create and manage reservations
- an administrator manual describing how to manage rooms and reservations
- online help documentation available within the application

Documentation will be delivered in digital format as web sub-page.

2.7. Assumptions and Dependencies

The system requirements are based on the following assumptions:

- users have valid university accounts for authentication
- focus rooms are physically available on campus
- the university provides server infrastructure or hosting for the system
- users have internet access to interact with the application

3. System Features

3.0. «Use Case Model»

3.1. «Room Browsing»

- The system shall allow users to view available focus rooms located on campus.
- Users shall be able to check room availability for specific dates and time slots before making a reservation

3.2. «Room Reservation»

- The system shall allow users to reserve a room for a selected time period.
- The reservation feature ensures that rooms cannot be booked by multiple users at the same time

3.3. «Room Management»

- The system shall allow users to view and manage their reservations.
- Users shall be able to cancel reservations or review previously booked time slots.

3.4. «Administrative Management»

- The system shall allow administrators to manage rooms and reservations.
- Administrators shall be able to add new rooms, update room information, and monitor existing reservations.

4. External Interface Requirements

4.1. User Interfaces Overview

«The system shall provide a graphical user interface (GUI) accessible through a web browser. The interface will allow users to interact with the system through standard graphical elements such as buttons, menus, forms, and calendar views.

Users shall interact with the system through the following screens:

1. Login Screen - users enter their university credentials to access the system.
2. Room List Screen - displays available rooms/pods and basic room information.
3. Availability Schedule Screen - shows available time slots for each room using a calendar-style interface.
4. Reservation Screen - allows the user to select a time slot and confirm a reservation.
5. My Reservations Screen - displays the list of reservations made by the user.

Administration Panel - available only to administrators for managing rooms and reservations.

Users shall interact with the interface using common actions such as:

- clicking buttons
- selecting time slots from a calendar view
- entering information into form fields

The interface shall provide immediate feedback to the user after each action. For example:

- confirmation messages after successful reservations
- error messages when a selected time slot is already reserved

Minimum interface requirements include:

- consistent screen layout across all pages
- clearly labeled navigation buttons
- visible error messages for invalid inputs
- confirmation messages after system actions
- responsive design to support both desktop and mobile devices

»

4.2. Hardware Interfaces

«The target version of the Campus Focus Room Booking System shall support integration with physical room devices in the future»

In the target architecture, each focus room may include:

- an occupancy sensor (to detect whether the room is physically used)
- an external status display (to show room state such as Available, Reserved, or Occupied)

The system shall be prepared to exchange status information with such devices when this infrastructure is introduced by the university.

Planned target behavior:

- the system shall receive occupancy signals from room sensors,
- the system shall update reservation status based on occupancy events,
- the system shall display room state data on external screen.»

4.3. Software Interfaces

To provide a clear overview of the system's internal structure and data organization, the following Class Diagram illustrates was created.

The diagram below shows the step-by-step process of booking a study booth. It tracks the student's request from the web interface to the database, showing how the system either issues a PIN and QR code for a successful booking or blocks the request if the room is already occupied.

«The Campus Focus Room Booking System shall operate as a web-based client-server application.

University Authentication Service

- The system shall interface with the university authentication service to verify user identities during login - and return the authentication result to the system.

The system shall receive the following data from the authentication service:

- user identifier (User ID)
- authentication status
- user role or access level

The system shall not store personal user data such as names, emails, or passwords. Only the unique user identifier provided by the authentication system shall be stored for reservation tracking purposes.

The database shall store only operational information required for system functionality, including:

- reservation identifier
- room identifier
- reservation start time
- reservation end time
- user identifier associated with the reservation
- reservation status

5. System Features/Modules

5.1. «Room Status Check»

This diagram tracks the physical status of a booth. A room stays 'Available' until a student books it. It then moves to 'Reserved' and only becomes 'Occupied' once the student enters their PIN or scans their QR code. If no one shows up within 10 minutes, the system automatically makes the room available again.

5.1.1 Description and Priority

This feature allows users to view the availability of focus rooms before making a reservation. Users can check which rooms are free and see available time slots.

5.1.2 Stimulus/Response Sequences

Stimulus: The user requests the list of available focus rooms.

Response: The system displays the list of focus rooms with their availability status.

Stimulus: The user selects a specific focus room.

Response: The system displays the reservation schedule for the selected room.

5.1.3 Functional Requirements

REQ-1.1: «Upon a user request, the system shall display a list of all available focus rooms.»

REQ-1.2 «Upon selecting a focus room, the system shall display the reservation schedule for the selected room.»

REQ-1.3 «The system shall indicate whether a room is available, reserved, or occupied.»

REQ-1.4 «The system shall update room availability information after each reservation or cancellation.»

5.2. «Room Reservation»

This flow follows the student from their initial search to entering the booth.

It shows the different ways to find a room (by ID, building, or size) and explains the check-in process. Once at the booth, the student can choose to either scan the QR code on their phone or type in their PIN to unlock the door.

5.2.1 Description and Priority

This feature allows users to reserve a focus room for a selected time slot.

The system ensures that a room cannot be reserved by more than one user at the same time.

5.2.3 Functional Requirements

REQ-2.1: «Upon a reservation request, the system shall verify whether the selected room and time slot are available.»

REQ-2.2«If the selected time slot is available, the system shall create a reservation record.»

REQ-2.3«The system shall assign a unique reservation identifier to each reservation.»

REQ-2.4«If the selected time slot is already reserved, the system shall reject the reservation request.»

REQ-2.5«Upon user request, the system shall display all reservations associated with the user identifier.»

REQ-2.6«Upon a cancellation request, the system shall delete the corresponding reservation record.»

6. Nonfunctional Requirements

6.1. Performance

NF-1.1: «The system shall respond to user interface requests within 4 seconds under normal operating conditions.»

NF-1.2: «The system architecture shall be designed to scale efficiently, with a target capacity for production to support peak campus user traffic without noticeable performance degradation.»

NF-1.3: «The system shall update room availability information within 5 seconds after a reservation is created or cancelled.»

NF-1.4: «The system shall process reservation requests within 3 seconds after submission.»

6.2. Security

NF-2.1: «The system shall authenticate users using the university authentication service before allowing access to reservation features.»

NF-2.2: «The system shall store only a unique user identifier associated with each reservation and shall not store personal user information.»

NF-2.3: «The system shall transmit all user requests and responses using secure HTTPS communication.»

6.3. Usability

NF-4.1: «A first-time user shall be able to complete a room reservation within 2 minutes.»

7. Current Implementation Scope (PoC)

<https://github.com/Nubet/Focus-Study-Room-Booking-System>

This release is a proof-of-concept focused on validating the core booking workflow.

The current PoC includes:

- room browsing and availability checking
- reservation creation and cancellation
- basic administrative management of rooms and reservations
- access flow based on PIN/QR logic

The current PoC does not include:

- university authentication integration
- physical occupancy sensors
- external room status displays
